Raw Material Process

We prefer best raw materials in our products.

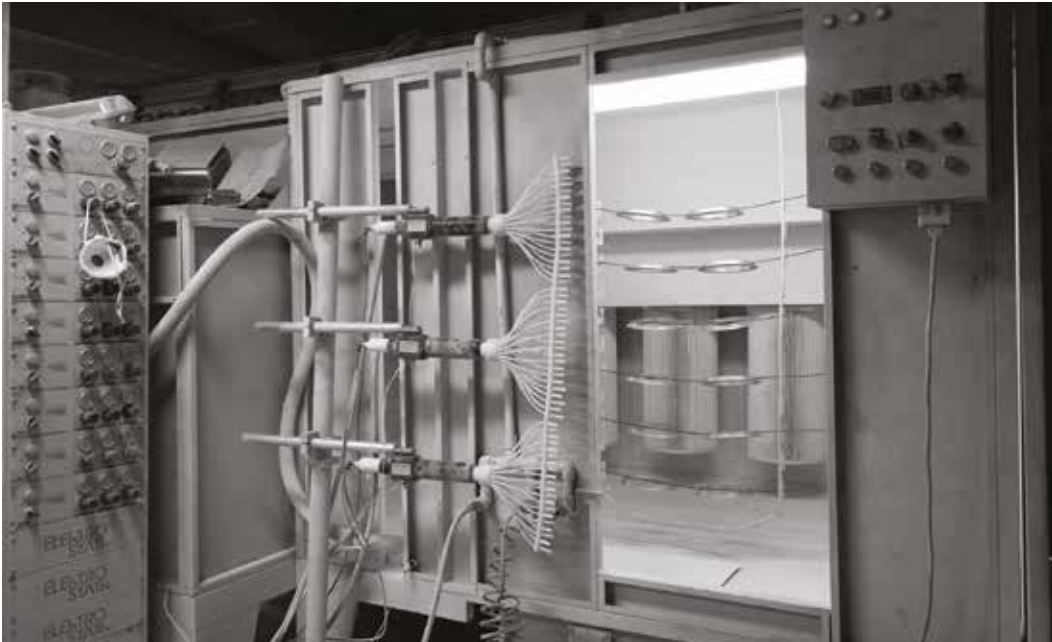

Our raw material is formed of firstclass metal and aluminium. High quality material helps us to minimize returns, possible defects and technical service necessities. The raw material is recyclable, eco-friendly and harmless.

Mould Room

We can adjust to various product types rapidly via thousands of mould stocks.

We design all lighting products in our own mould room. We can generate hundreds of different moulds in a very short time to achieve functional details and aesthetic solutions by hightech machines and counters.

Paint Shop

We have the necessary equipment to perform electrostatic and powder coated painting.

Powder coating is a type of coating that is applied as a free-flowing, dry powder. The main difference between a conventional liquid paint and a powder coating is that the powder coating does not require a solvent to keep the binder and filler parts in a liquid suspension form.

Led Assembly Line

Led Components assembled on the card through automation

Custom design electronic circuits and led components are applied high intensified aluminium powered card.

Assembly Lines

Components are mounted on several assembly lines by considering each distinct product type.

Different parts of the product body is assembled through work stations connected to each other on assembly line. Hence, final product is developed. Various products or variations of same product are constructed in seperate batches with respect to priority relations of technology.

Quality Control

The products which are ready for packaging are inspected by quality control.

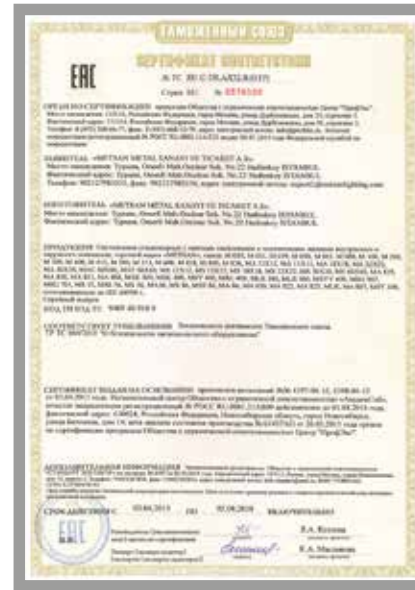

Our lighting products which can get in every room easily are a result of the system we built in our factory. We are aware of the direct relationship between the product and the system. Therefore, we believe that taking over system parameters allows us to examine the properties of the product.
